! 43 Semi-important fixes

Wondering how well your website is performing? Here you can check your website against the major SEO parameters and see whether your site has the proper WWW redirect, SEO and user-friendly URLs with trailing slashes, functional robots.txt file, XML sitemap, duplicate content, etc. Take advantage of the website health check to eliminate all possible errors, and follow our recommendations on how to increase your search engine visibility.

✓ WWW redirect

This option checks whether your website runs with www or without www in order to avoid the usage of duplicate content.

✓ URL rewrite

Make sure to rewrite your URLs that will help users and search engines see clear and clean URLs. Your website's URLs shouldn't contain vague elements that will make them difficult to read. All URLs should be clean and clear for users. With SEO Friendly URL it is easy to rank your website in search engines and share different articles with clear URLs in social media. Don't use underscores in your URLs.

✓ Trailing slashes

If you use the trailing slashes at the end of the URL it makes it pretty and clear, while the URL without slash will look quite weird.

✓ Redirects HTTP traffic to HTTPS

HTTPS is a guarantee of user data protection (including payment details), as well as a good ranking signal for search engines. In 2016, Google officially [announced](#) that since January 2017 a secure communication will become the official algorithm. So, sites on HTTP will gradually lose their positions.

✓ Robots.txt

Robots.txt file helps to restrict access for the selected search engine robots and prevent them from indexing specific pages or the whole of the website. Robots.txt file contains the link to the XML sitemap file that helps search engine crawlers to discover and index the maximum number of the website's pages.

✓ XML sitemap

You should specify the change frequency for each URL, time when you have made the last changes and the importance of the URLs. You will help search engines to crawl the site easily and intelligently.

✓ No flash

Optimizing your content for search engines, we recommend you to avoid Flash as much as possible. It is better to use Flash for specific enhancements as search engines can't index properly Flash content.

⚠ No frame

Try not to use frames on your website as search engines can't index or crawl your website content via them.

Avoid the use of frames on your web pages as much as possible and use the [NoFrames tag](#) on website.

✓ Common homepage variations

Make sure that your website content doesn't have multiple URLs as Google will consider it as duplicate content.

Keep in mind that unique content plays a vital role in search engine results. Your website structure should include HTML headings (h1-h6). Try to use important keywords in your headings. The tag H1 must have the most important keywords. Don't use [duplicate content](#) for your heading tags. The best variant is just to use h1-h3. Write only unique content, no duplicate and rewritten content. Keep your content with 400 words and more. Too long articles are not good either. It is better to keep a happy medium. Try to minimize the number of spelling and grammar mistakes.
